

Wolf Conservation and Management 2018 Annual Wolf Update

*Washington Department of
FISH and WILDLIFE*

Wolf Plan Objectives

- Restore self-sustaining wolf populations
- Maintain healthy ungulate populations
- Manage wolf – livestock conflicts
- Develop public understanding and promote coexistence

Wolves are returning to Washington

Dispersers from adjacent states and provinces, as well as resident WA packs, are naturally recolonizing the state

Federal Status

- Western 2/3 – Endangered
- Eastern 1/3 - Delisted
 - Included in NRM DPS: 2007
 - Delisted in 2011
- No federal wolf recovery requirements
 - WA status not figured into NRM delisting
- Proposed Rule to Delist–
15 March 2019, public comment extended to July 2019

State Status

- Endangered species statewide
- Wolf Conservation and Management Plan: 2011
 - 3 recovery areas
 - Delisting requirements
- Federal, state, tribal management

Definitions

- Pack
 - Two or more wolves traveling together in a defined territory
- Successful breeding pair
 - Male and female raising two or more pups until Dec 31

Monitoring the Populations

- Follow-up surveys
 - Cameras
 - Tracks and other sign

- Reports from the Public
 - Sighting Reports
 - Depredations

- Attempt captures
 - Aerial captures - winter
 - Radio collared packs
 - Ground Captures - summer

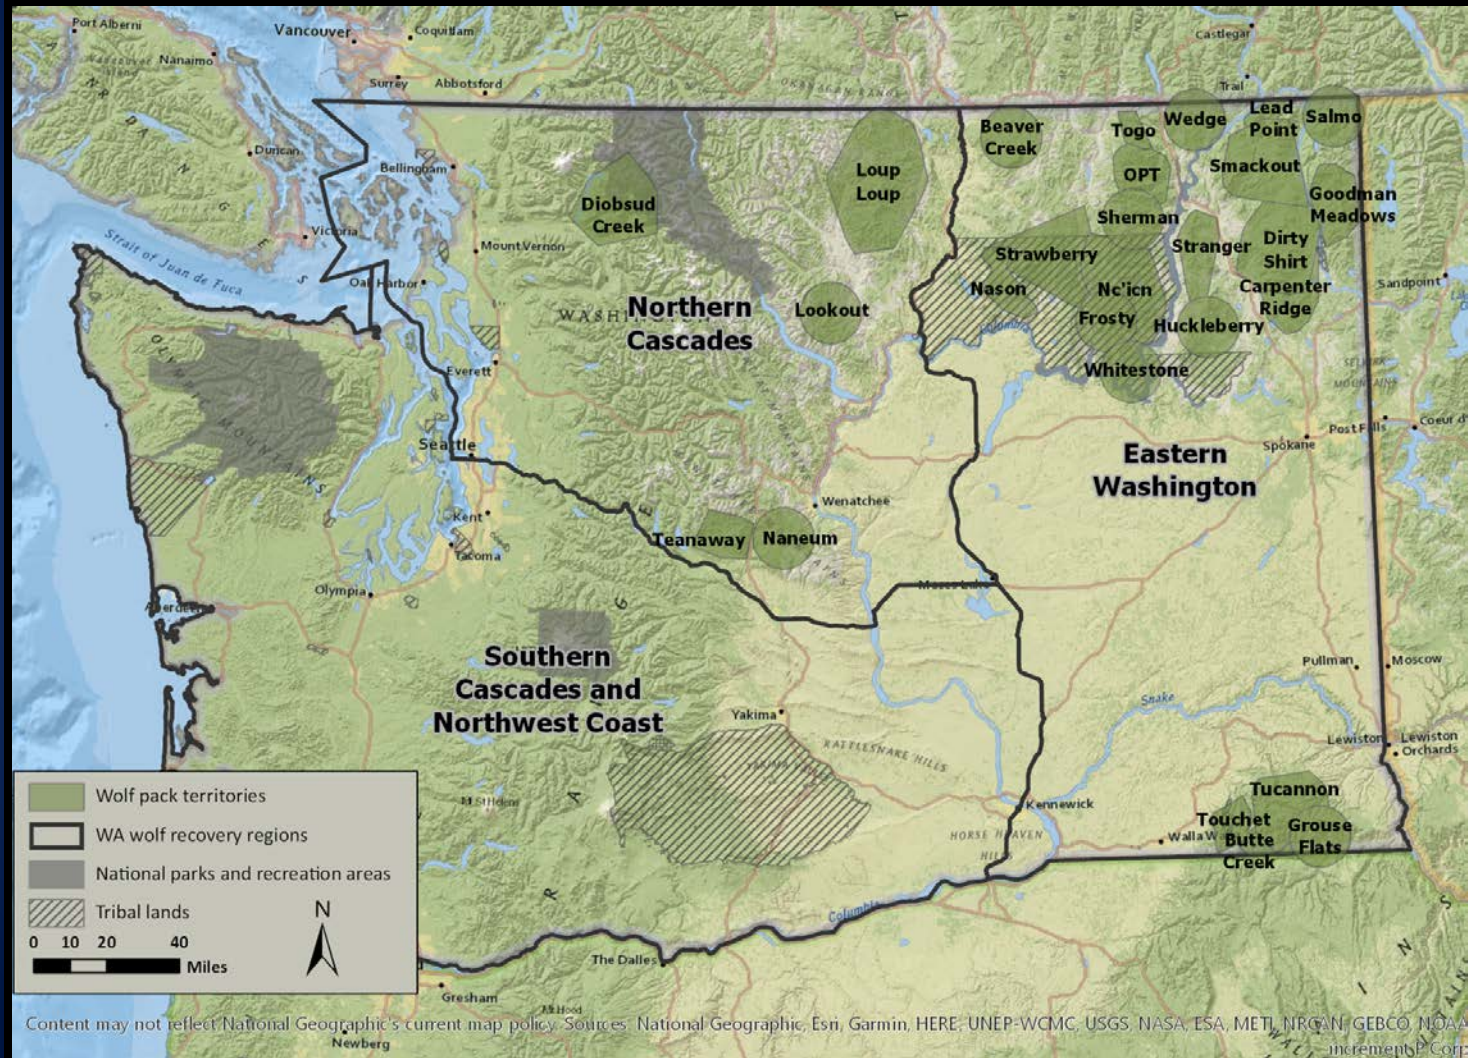

Capture and Monitoring 2018 Calendar Year

- Captured 9 wolves - From 8 different packs
- Monitored 20 wolves from 15 packs
 - Currently monitoring 18 collared wolves (14% of minimum number of known wolves) from 11 packs (41% of known packs) in Washington

Washington's Known Wolf Packs

Washington Wolf Population Summary

Year	Min Count	Known No. of Packs	SBP	Growth Rate	Known Wolf Mortality	Depredating Packs (%)
2008	5	1	1	--	0	0%
2009	14	2	2	--	0	0%
2010	19	3	1	36%	2	0%
2011	35	7	5	84%	0	0%
2012	51	9	5	46%	9	33%
2013	52	13	5	2%	5	8%
2014	68	16	5	31%	10	13%
2015	90	18	8	32%	7	22%
2016	115	20	10	28%	14	20%
2017	122	22	14	6%	14	23%
2018	126	27	15	3%	12	19%
Ave				28%		13%

Wolf – Livestock Interactions

- Wildlife Conflict Specialists
 - Coordination w/ producers
 - DPCA-Ls
 - Contract Range Riders
 - Deterrence measures
- Lethal Removal
- Compensation

Contracted Range Riders

Cost – Share Agreements

Promoting Deterrence Measures

- Sanitation
- Sick and injured livestock
- Calving and lambing areas
- Timing of Turnout
- RAG (radio activated guard)
- Range riders and sheepherders
- Fencing
- Fladry
- Foxlights
- Other techniques

Packs Depredating on Livestock

Wolf Depredations in Washington

2018 Wolf-Caused Livestock Mortality By Month

Wolf – Livestock Interaction Protocol

WASHINGTON DEPARTMENT OF FISH AND WILDLIFE

Wolf-livestock interaction protocol
Revision date June 1, 2017

This protocol was jointly developed by the Washington Department of Fish and Wildlife (WDFW or Department) and its Wolf Advisory Group to guide the Department's efforts to reduce conflicts between wolves and livestock. The Wolf Advisory Group has expressed a strong value to reducing the likelihood of the loss of both wolves and livestock from adverse interactions. The protocol prescribes a variety of proactive measures livestock producers can take to reduce the probability of wolf-livestock conflicts and establishes a framework for WDFW's response when conflicts between wolves and livestock do occur.

The protocol draws on a diversity of perspectives expressed by people throughout the state for protecting wildlife populations as a public resource and livestock. These values include achieving a sustained recovered wolf population, supporting rural ways of life, and maintaining livestock production as part of the state's cultural and economic heritage. This protocol also serves to increase the transparency and accountability of the Department's activities and management actions related to wolves.

Section 1. Background and purpose of protocol

Gray wolves are listed as endangered under the federal Endangered Species Act (ESA) of 1973 in the western two-thirds of Washington, but are federally delisted in the eastern-third of the state (Fig. 1). Under Washington State rule, gray wolves as endangered statewide. Under the Federal listing status, the U.S. Fish and Wildlife Service (USFWS) is the lead agency for managing wolves in the western two-thirds of Washington, and WDFW has full management authority for wolves in the eastern third.

Figure 1. Federal classification of gray wolves in Washington State, 2017.

Research

- **Completed Projects:**
 - **A. Valerio (WSU)** - Stress-Mediated and Habitat-Mediated Risk Effects of Wolves on Free-Ranging Cattle in Washington
- **Ongoing Projects:**
 - **WDFW - Predator/Prey Project**
 - **T. Ganz (UW)** - Ungulate – Predator Dynamics in Northern WA
 - **L. Satterfield (UW)** - Interactions between wolves & cougars in eastern Washington State
 - **L. Prugh (UW)** - Interactions among large & small carnivores in WA
 - **S. Bassing (UW)** - Spatiotemporal dynamics of predator-prey interactions as wolves recolonize Washington
 - **T. Roussin (UW)** – Methods for long-term monitoring of wolf populations
 - **J. Goerz (UM)** - Effects of Summer Habitat Selection on Survival and Reproduction of Moose in Northeast Washington
 - **S. Wasser (UW)** - Monitoring impacts of wolf recovery in WA State
 - **S. Warren (UM)** - Influence of gray wolves on interspecies movement patterns in the Central Cascades

Wolf Advisory Group

- Met four times in 2018
- Guidance on wolf management
 - Expectations on preventative measures and potential agency management actions
- Restructure of WDFW participation
- Began discussing how wolf management might change after delisting

Outreach

- Updating WDFW Website
- Wolf Advisory Group
- Daily Interactions
- Formal Presentations

Questions?

Update on treponeme-associated hoof disease of elk in Washington | GMAC meeting June 8, 2019

Kyle Garrison

Washington Department of Fish and Wildlife

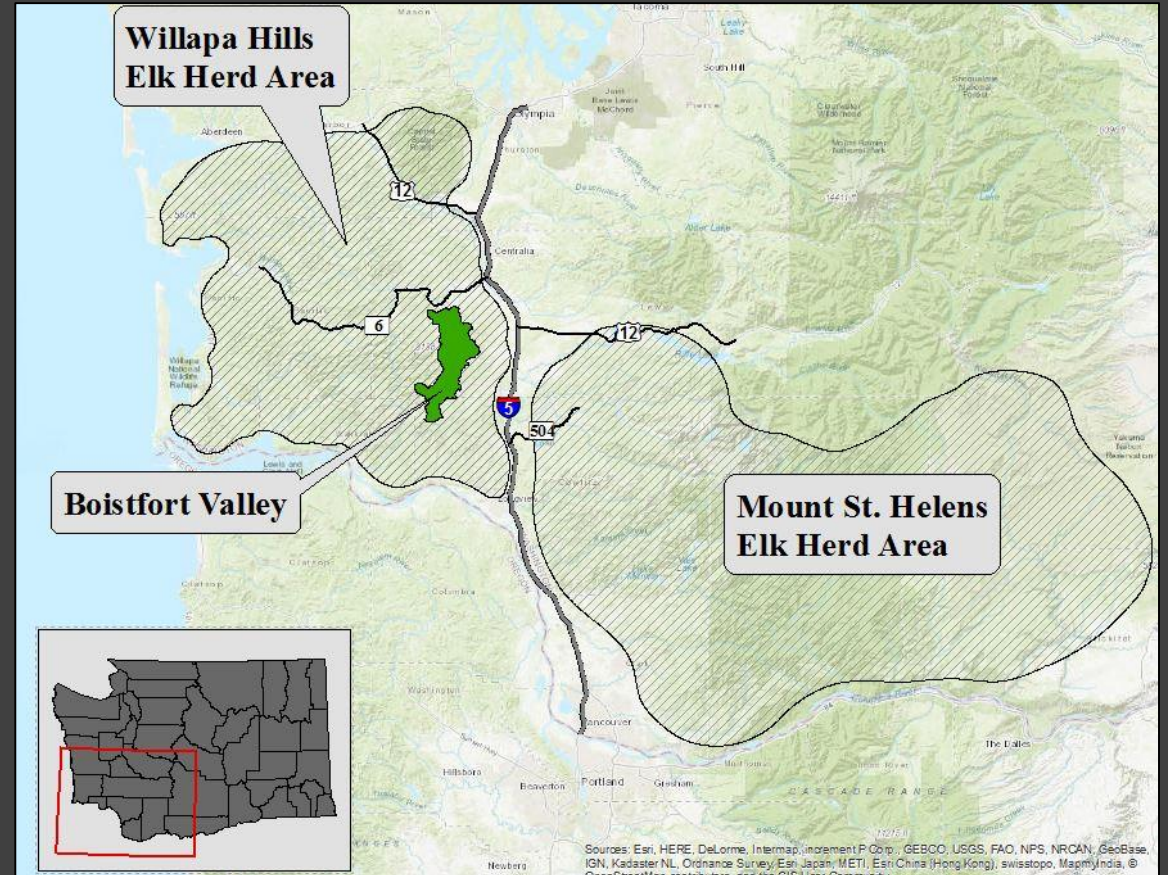

Content

Disease overview (digital dermatitis)

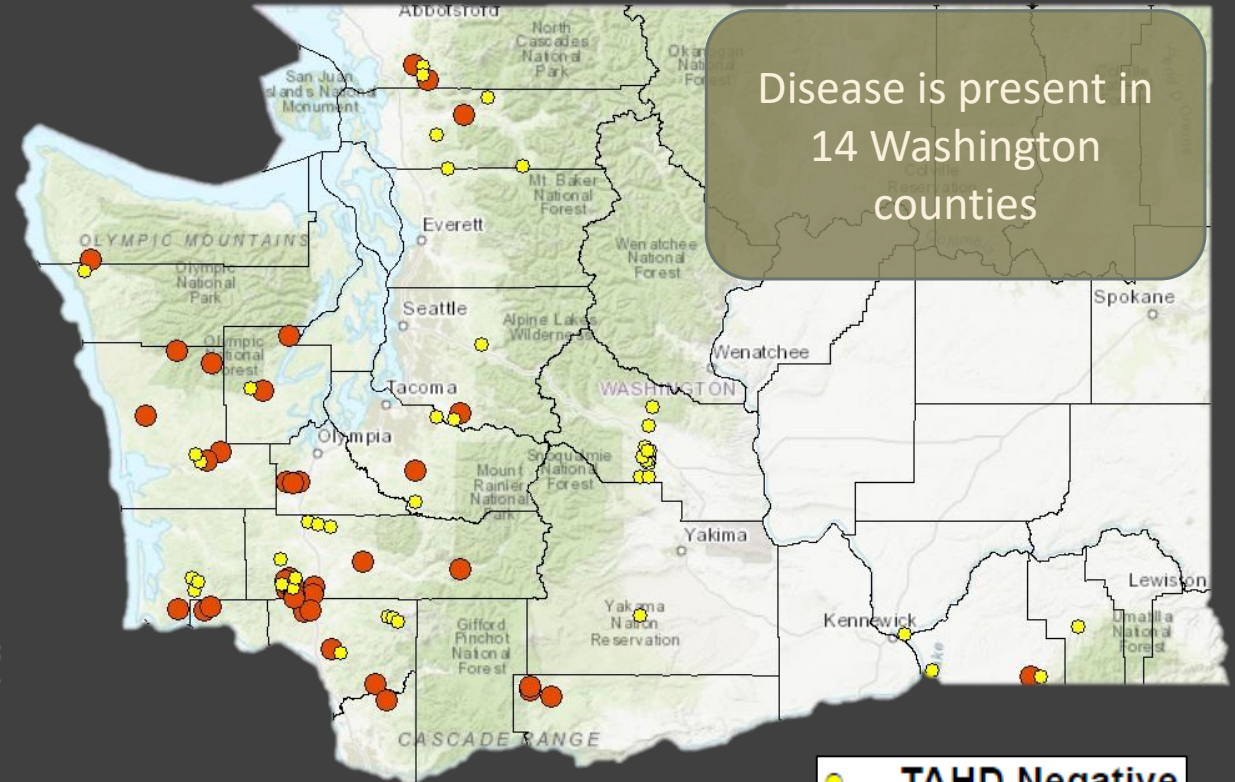

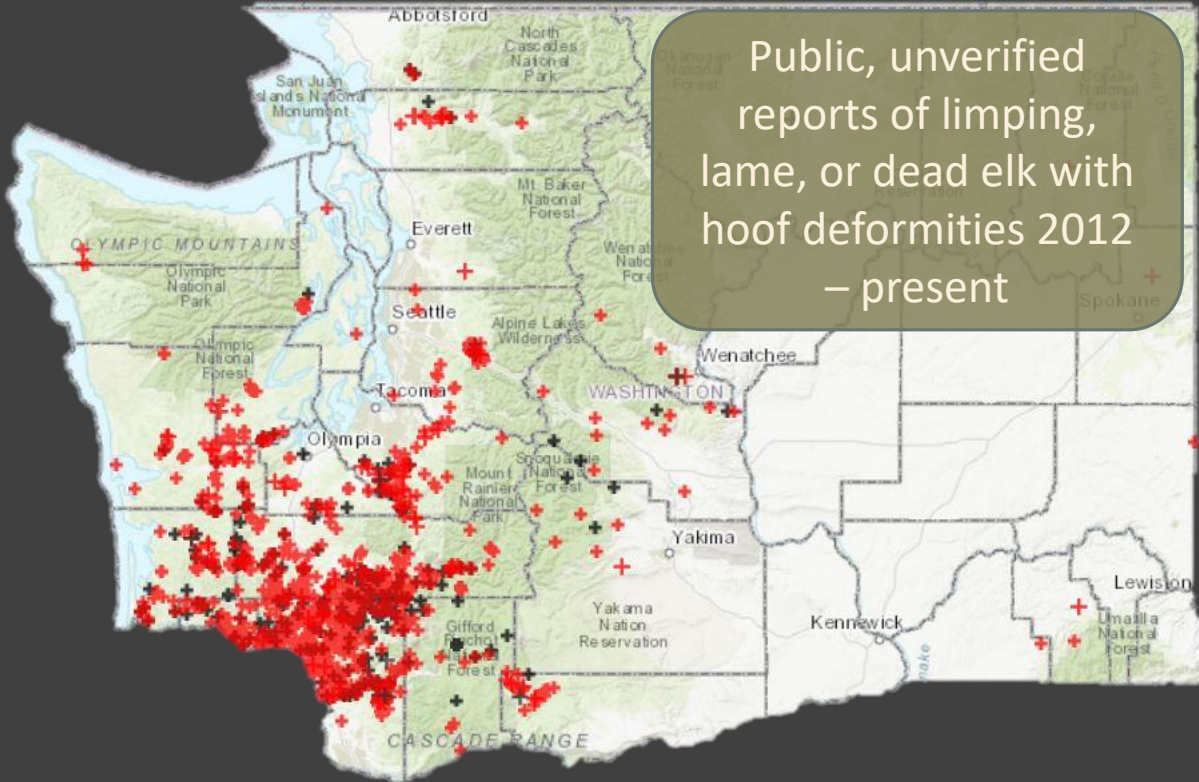

- No effective vaccines, some treatments
- High recurrence rates
 - All domestic treatments impractical for elk
- Despite decades of research, many questions remain e.g., transmission and initiation
- Priority research for Washington State University program on TAHD

Disease overview

Public, unverified reports of limping, lame, or dead elk with hoof deformities 2012 – present

Disease is present in 14 Washington counties

● TAHD Negative
● TAHD Positive

Prevalence

- Wildlife disease prevalence important for management, but difficult to estimate
- For TAHD, limping or abnormal hooves are generally a reliable indicator of infection
- Several approaches used since 2015; consistent results, considerable tradeoffs

Hunter reporting

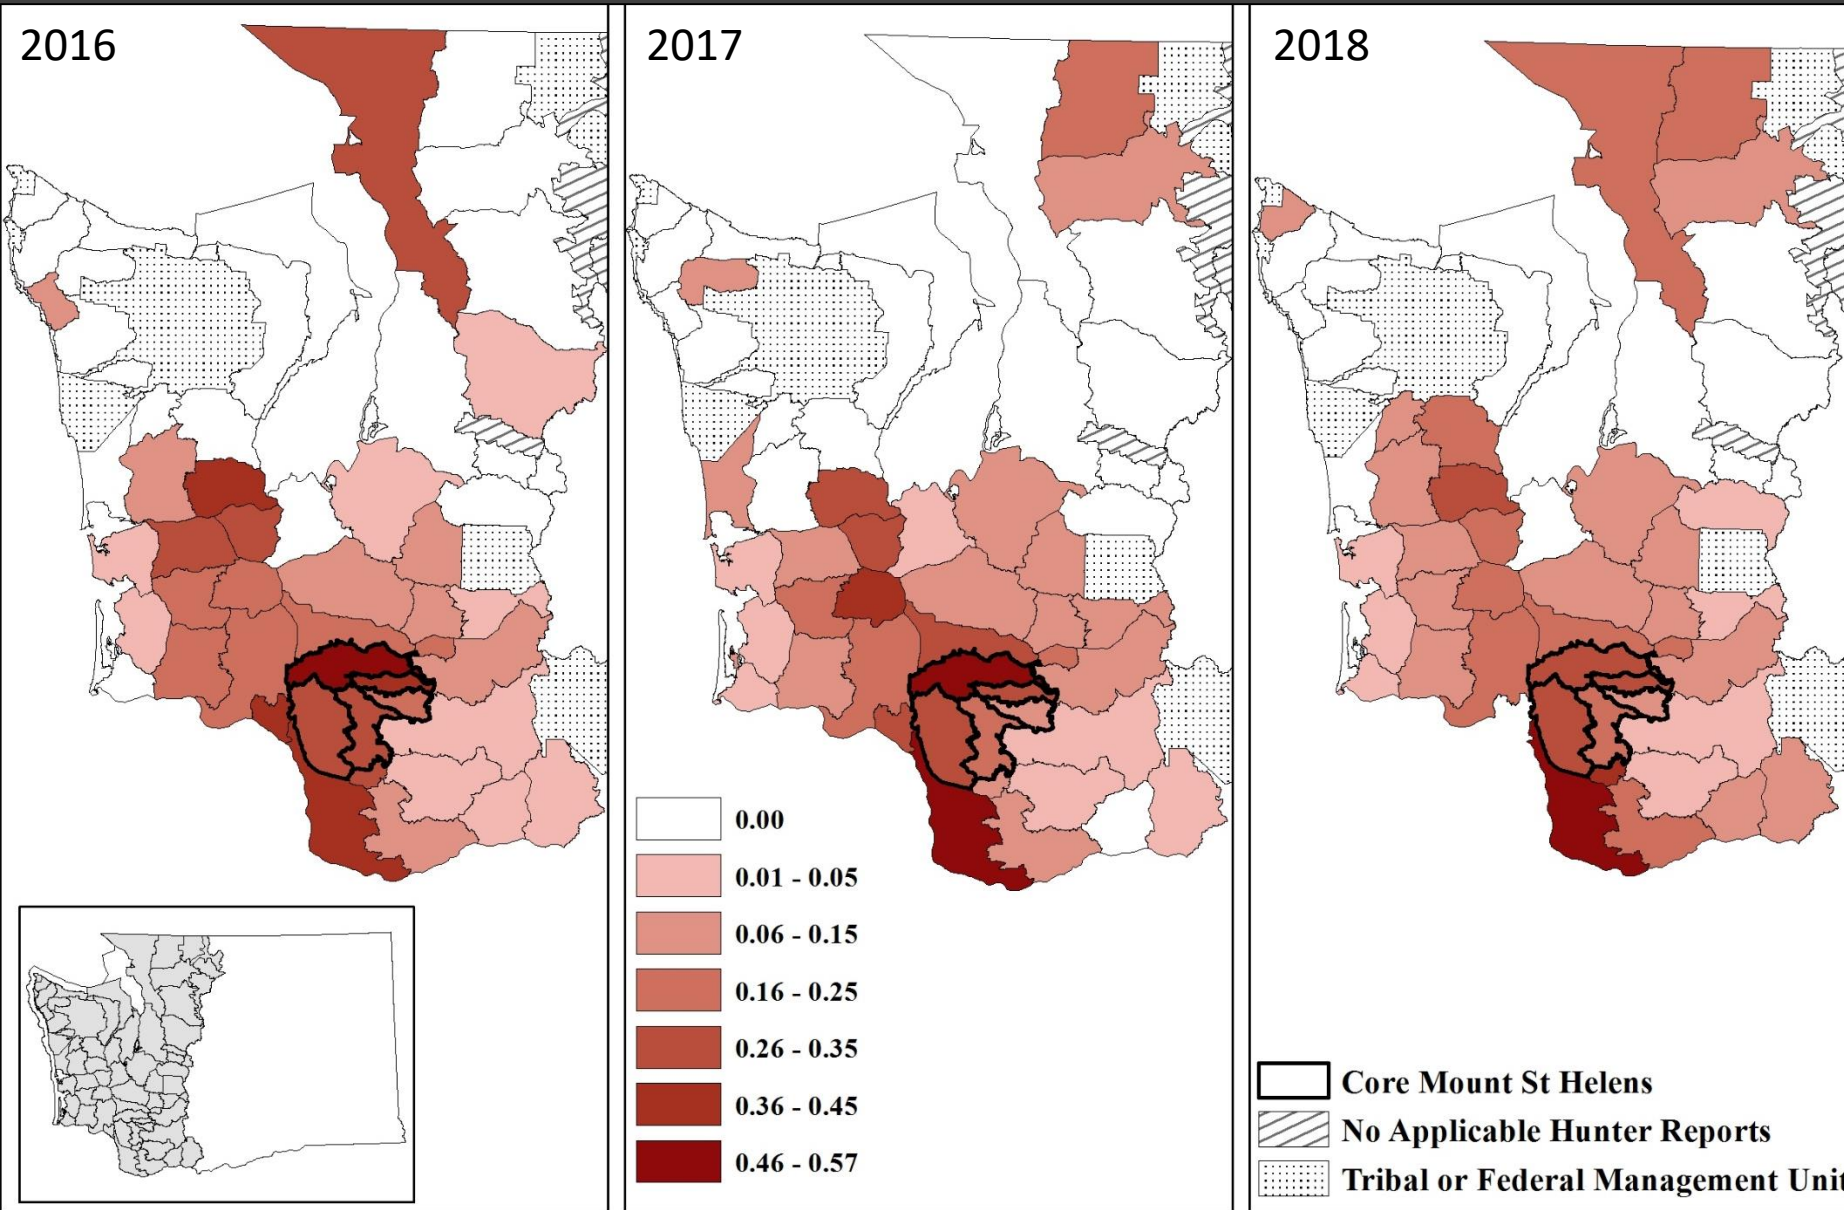

- Mandatory in WA; cheap, potentially reliable index
- Observation of hoof abnormalities used as an index of prevalence at management unit scale
- Subsample permit hunters to assess hunter bias and outreach efforts

W. WA	N	Estimate	95% CI
2016	2494	0.15	0.14-0.16
2017	2247	0.11	0.10-0.12
2018	2728	0.11	0.10-0.12

MSH Core	N	Estimate	95% CI
2016	447	0.40	0.36-0.45
2017	290	0.32	0.27-0.38
2018	324	0.27	0.22-0.32

	2016	2017
False Negative	0.48	0.31
False Positive	0.04	0.03

Disease impacts

Mount St Helens elk herd
2015 – 2019

Objectives:

1. Estimate disease impacts on survival and productivity
2. Determine cause-specific mortality
3. Better understand disease progression

257 capture events; 180 individuals
77 recaptures
122 with TAHD, 55 healthy, 3 pending

Body condition

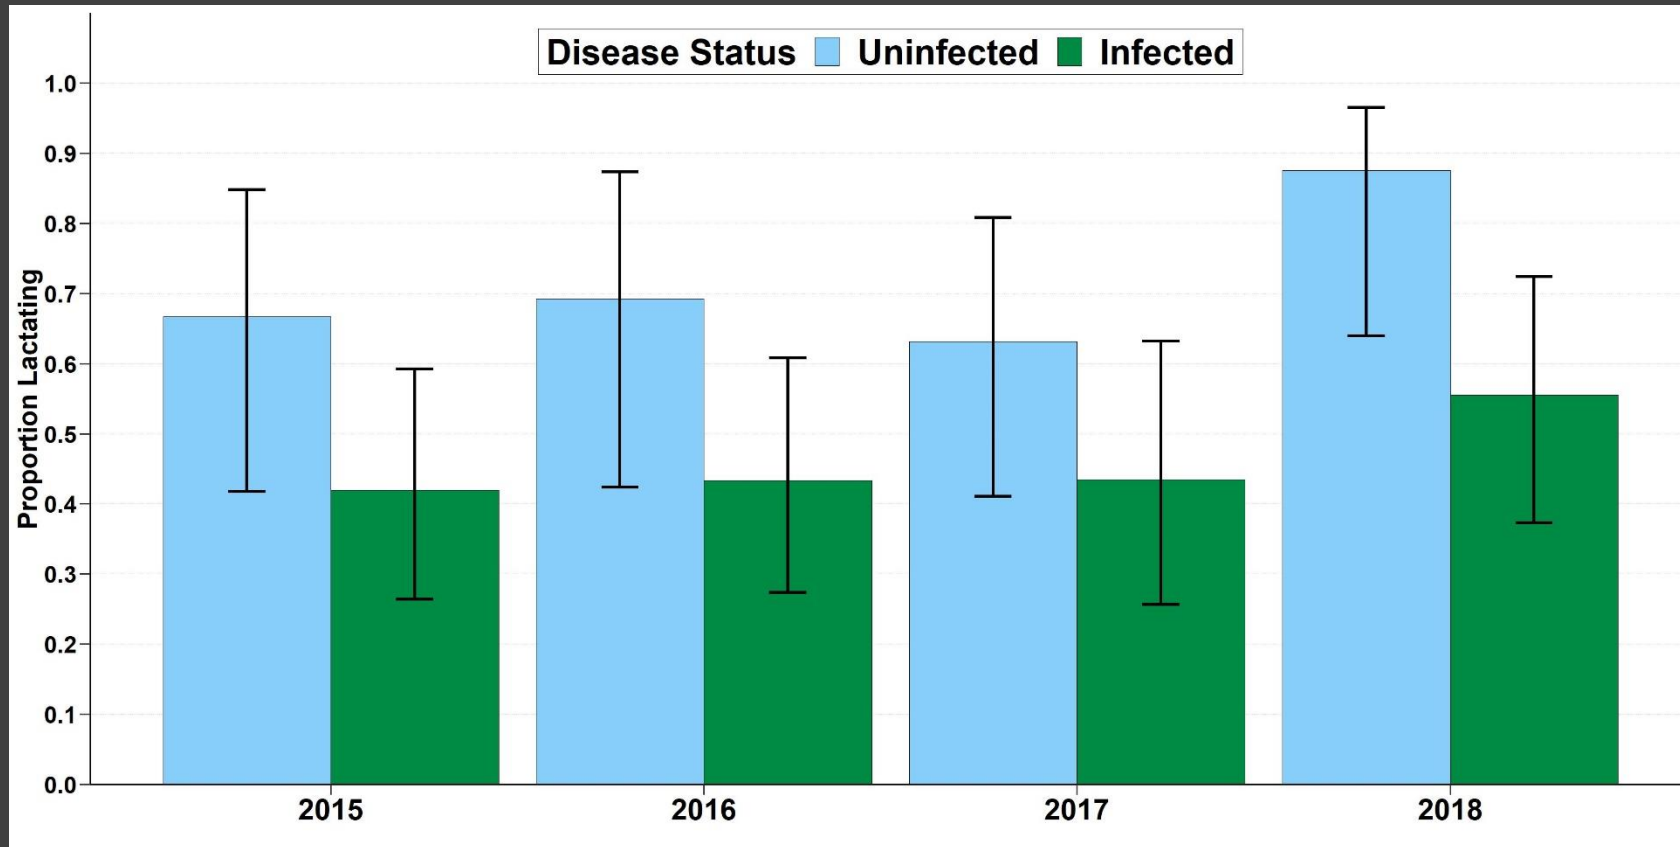

*Lactating adult females (3-12yrs)
Cook et al. 2004

Pregnancy rates

Lactation rates

Survival

Cause-specific mortality

Future work

- Continue refining and exploring prevalence estimation methods
- Finalize survival and productivity research
- Explore and evaluate management efforts to reduce prevalence

- Continue biomedical, epidemiological, and human dimensions collaborative research with Washington State University, USDA, others

Questions?

THE PREDATOR-PREY PROJECT: RESEARCH UPDATE JUNE 2019

Photo: National Park Service

RESEARCH QUESTION

How is predation affecting Washington's ungulate populations in landscapes occupied by varying densities of wolves that are sympatric with other predators?

Photo: National Park Service

ADULT UNGULATE CAPTURES TO DATE

Led by WDFW (Melia DeVivo)

- **Mule Deer: 102**
 - Achieved target sample January 2018
 - Pregnancy was 100% and 94% in 2016/17 and 2017/18, respectively
 - Redeploy collars winter 2019/20 to account for annual attrition
- **Elk: 56**
 - Achieved target sample January 2018
 - Ages ranged from 1 – 14 years old, mean age 6 years old
 - Pregnancy was 85% and 91% in 2016/17 and 2017/18, respectively
 - Redeploy collars winter 2019/20 to account for annual attrition
- **White-tailed deer: 96**
 - Achieved target sample March 2019
 - Pregnancy was >90% during all three winter captures
 - Deployed 65 collars this past winter
 - New capture tools and methods
 - Greater knowledge and skill
 - Additional on the ground support

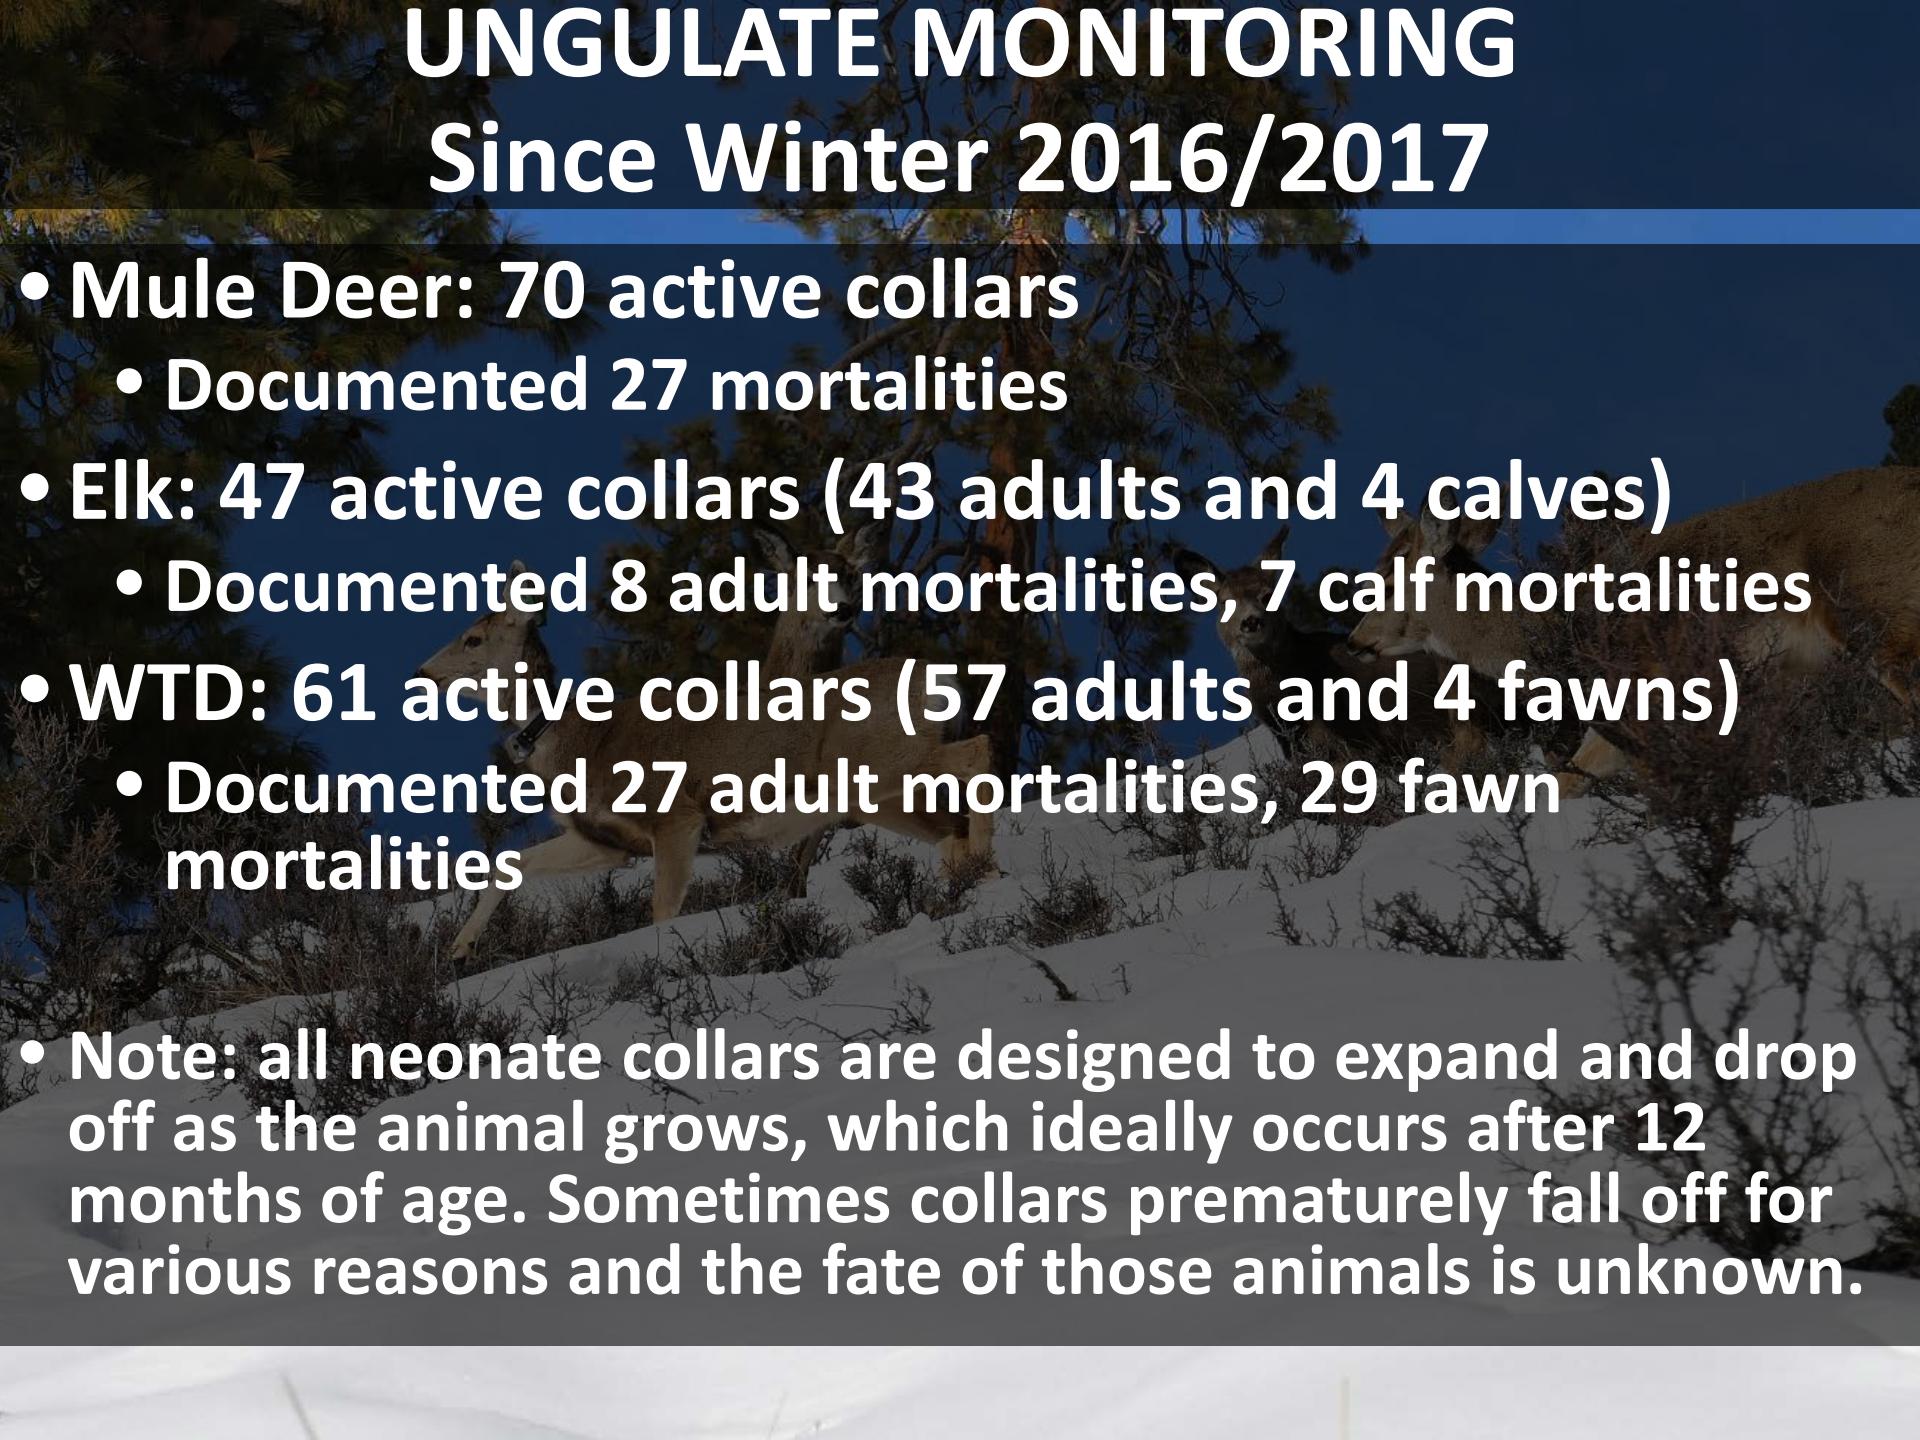

JUVENILE UNGULATE CAPTURES TO DATE

Led by UW (Taylor Ganz, Laura Prugh)

- **Elk: 16**
 - Captured during 2018 calving season
 - UW will attempt to collar 30 additional calves this summer
- **White-tailed deer: 69**
 - Captured during 2017-2018 fawning seasons as neonates and 6-month olds during 2018/19 winter capture
 - UW has 62 neonate collars they will attempt to deploy this summer
- **Note: no mule deer fawns will be captured for this study due to limited funding and challenging capture logistics**

UNGULATE MONITORING

Since Winter 2016/2017

- Mule Deer: 70 active collars
 - Documented 27 mortalities
 - Elk: 47 active collars (43 adults and 4 calves)
 - Documented 8 adult mortalities, 7 calf mortalities
 - WTD: 61 active collars (57 adults and 4 fawns)
 - Documented 27 adult mortalities, 29 fawn mortalities
 - Note: all neonate collars are designed to expand and drop off as the animal grows, which ideally occurs after 12 months of age. Sometimes collars prematurely fall off for various reasons and the fate of those animals is unknown.
- 

PROXIMATE CAUSE OF MORTALITIES

COUGAR CAPTURES – NORTHEAST

- WDFW – Brian Kertson
- Captures began in December 2016
- 51 total, 29 adults and subadults collared:
 - 10 adult females
 - 9 adult males
 - 5 subadult females
 - 5 subadult males
- Remaining captures are kittens

COUGAR CAPTURES - OKANOGAN

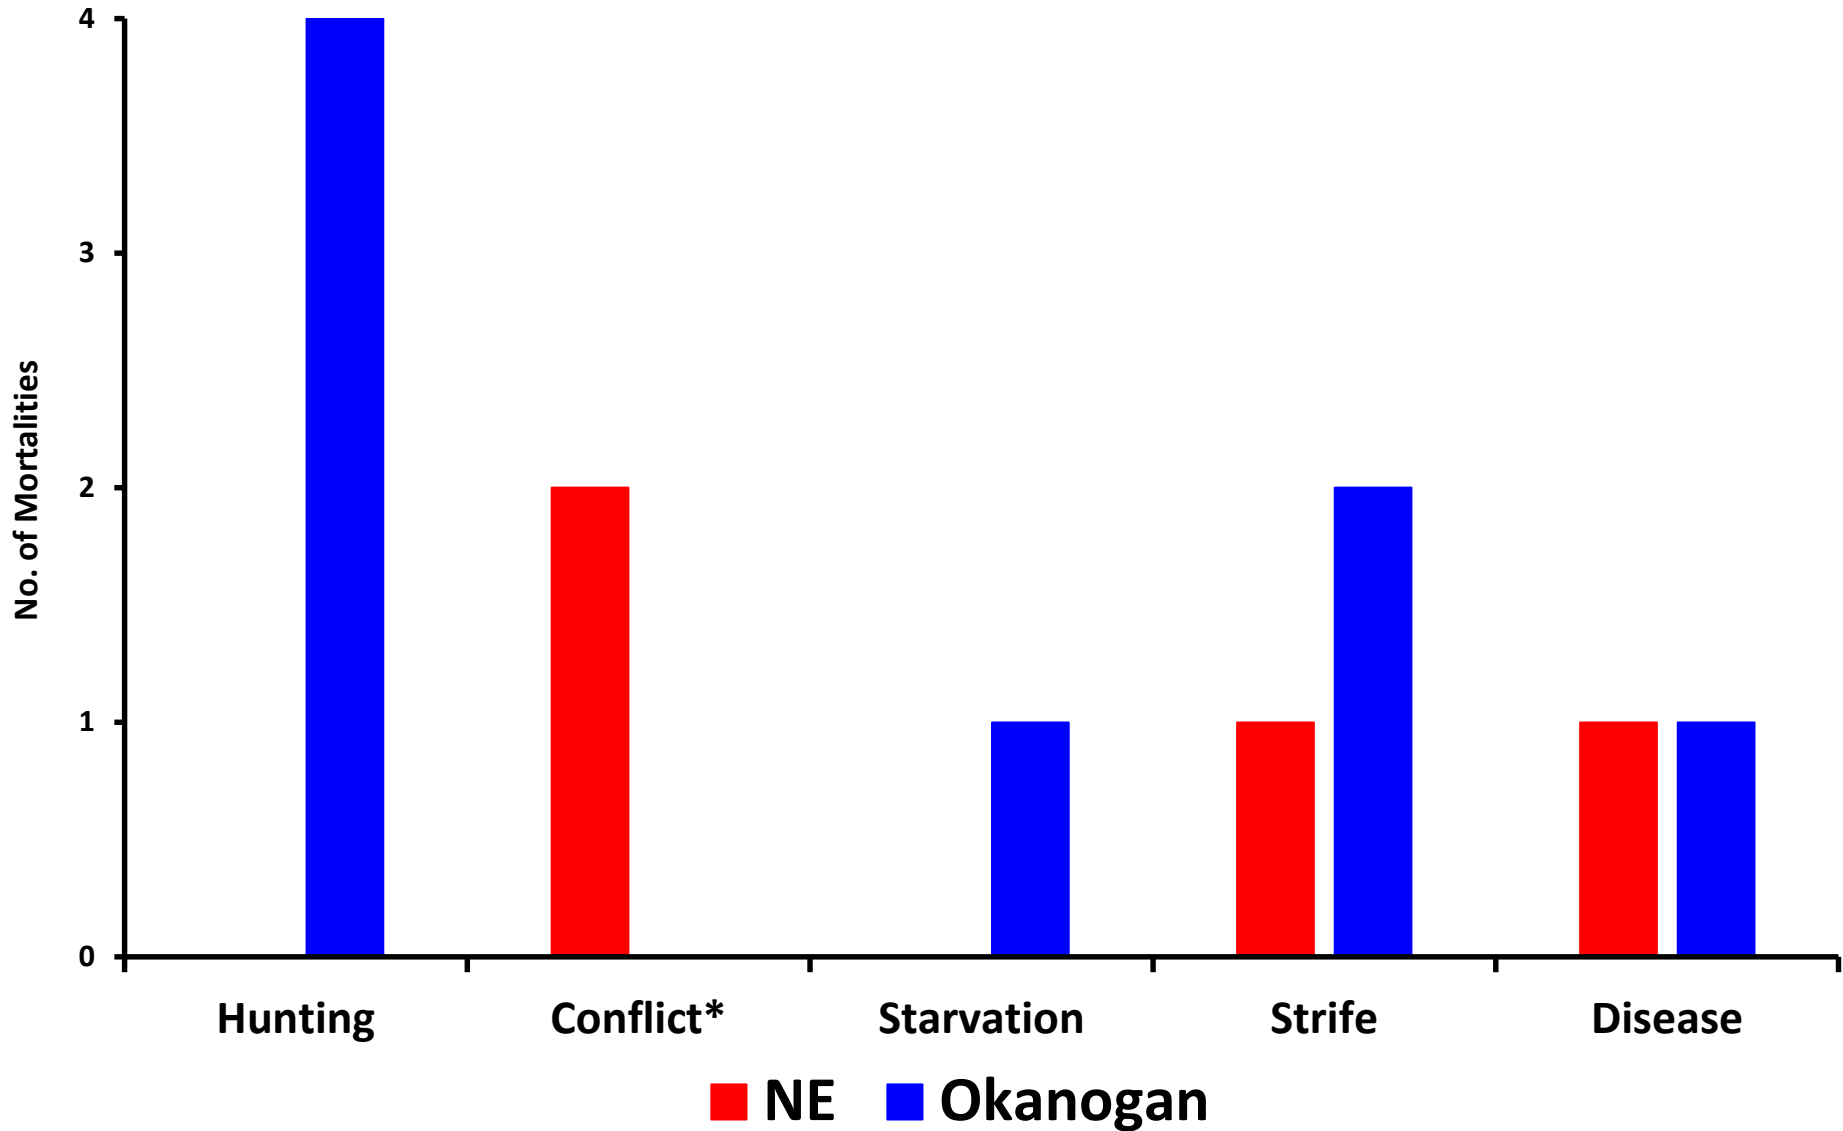

- UW – Lauren Satterfield (Ph.D. student)
- Captures began in December 2016
- 25 total, 21 adult and subadults collared
 - 10 adult females
 - 6 adult males
 - 4 subadult females
 - 1 subadult male
- Remaining captures are kittens

CURRENT COUGAR MONITORING

- **NE: 22 active collars**
 - 11 females, 11 males
 - 4 mortalities
 - 1 dispersal (Okanogan Valley in Canada)
 - 2 missing (collar malfunction, broken spacer)
- **Okanogan: 10 active collars**
 - 7 females, 3 males
 - 8 mortalities
 - 3 missing (collar malfunction)

COUGAR MORTALITIES – MAY 31, 2019

WOLF CAPTURES

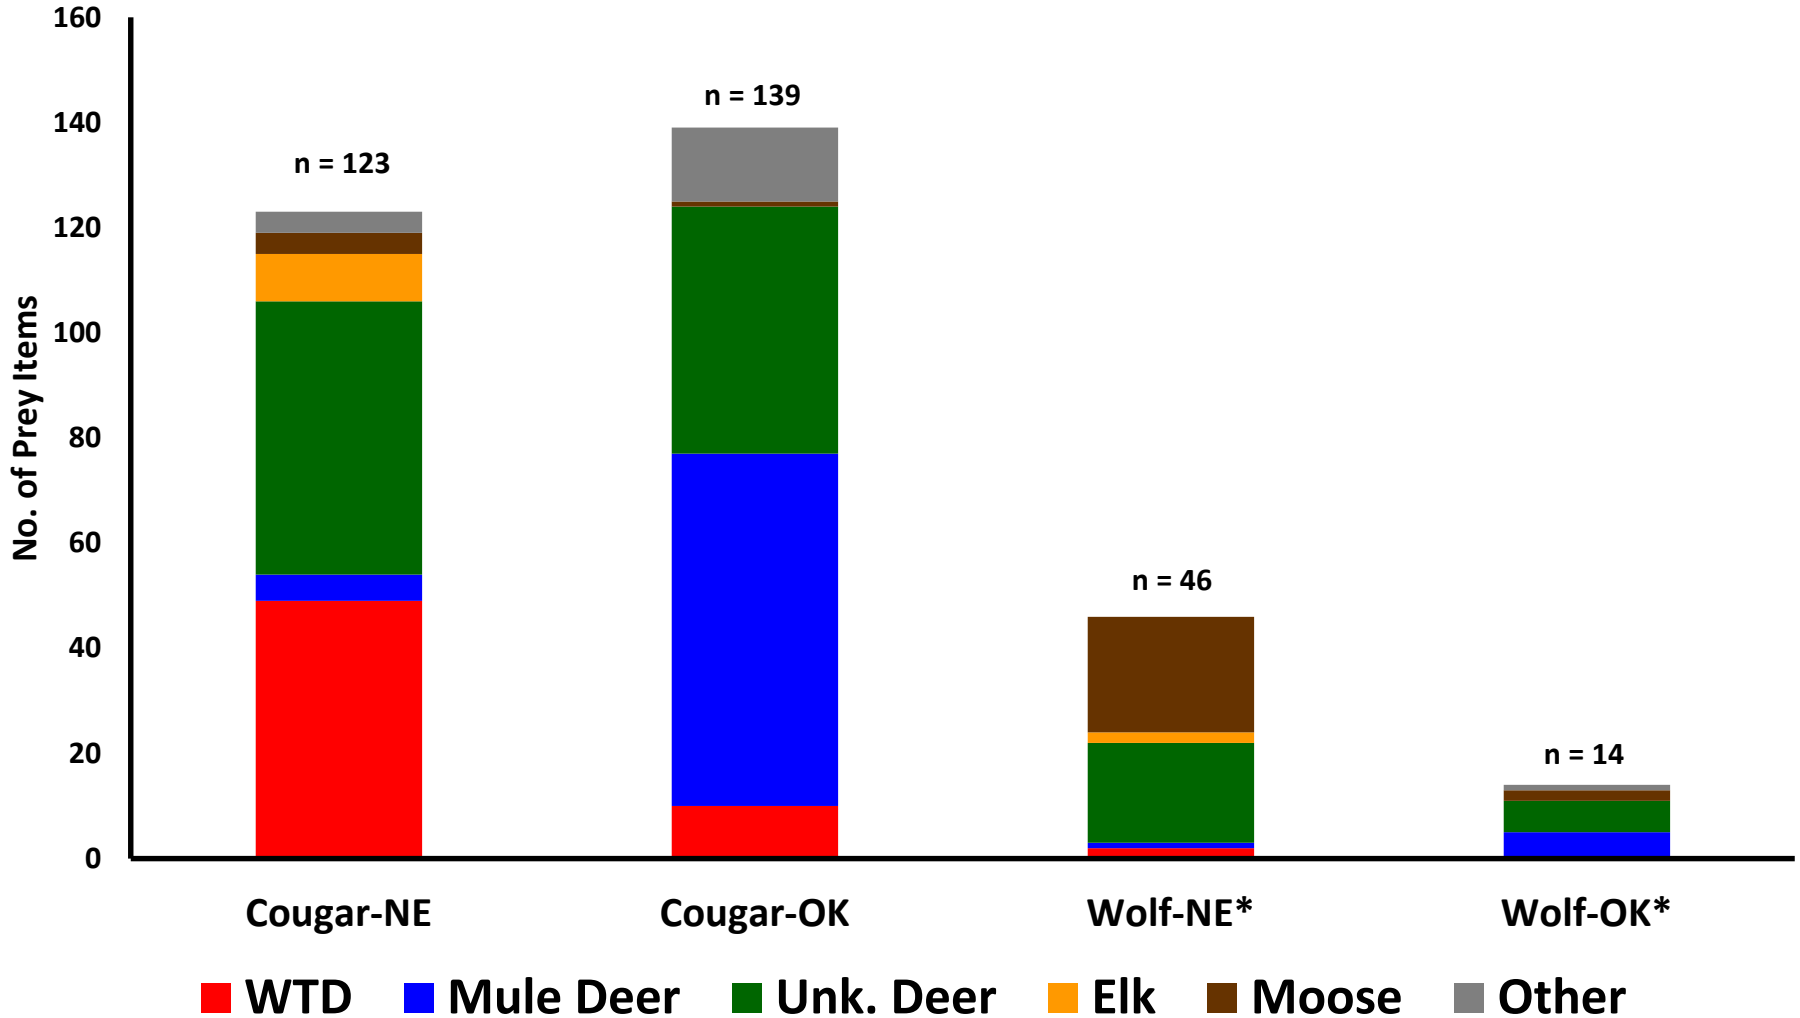

- WDFW wolf bios
- Capture efforts began in January 2017
- 16 wolves collared in research packs:
 - Carpenter Ridge: 4 (2 adult m, adult f, subadult f)
 - Dirty Shirt: 2 (subadult f, adult f)
 - Huckleberry 1 (subadult f – Spokane Tribe)
 - Lookout: 2 (subadult m, adult m)
 - Loup Loup: 4 (adult f, subadult f, adult m, subadult m)
 - Stranger: 3 (adult f, subadult f, subadult m)

CURRENT WOLF MONITORING

A pack of wolves is shown in a snowy, mountainous landscape. The wolves are of various colors, including black, brown, and grey. They are scattered across the scene, some standing and some walking. The background shows a snow-covered mountain range under a clear sky.

- Collars currently deployed:
 - Carpenter Ridge: 3 GPS (1 missing – collar malfunction)
 - Dirty Shirt: 0 (1 dispersed, 1 poached)
 - Huckleberry: 1 GPS (Spokane Tribe's collar)
 - Loup Loup: 1 GPS, 1 Vhf (2 dispersed)
 - Lookout: 2 GPS
 - Stranger: 1 GPS (1 dropped collar, 1 dispersed & killed)

CARNIVORE PREY USE – MAY 31, 2019

QUANTITATIVE INVESTIGATIONS

- Sarah Bassing (Beth Gardner) – UW
- Modeling predator-prey dynamics
- Maintain 60 active cameras in each study area
- One year of data collection completed
- Thousands of photos of target species already
- Currently redistributing cameras for the coming year

A close-up photograph of a bobcat's face, showing its eyes, whiskers, and fur. The image is darkened with a semi-transparent black overlay to make the white text stand out. The text is centered and reads "MESOCARNIVORES" at the top, followed by a bulleted list of project details.

MESOCARNIVORES

- **Becca Windell (Laura Prugh) – UW**
- **Independent NSF funding**
- **Impacts of large carnivores on coyotes and bobcats (facilitation vs. suppression)**
- **17 bobcats collared (8 in NE, 9 in OK)**
- **8 coyotes collared (6 in NE, 2 in OK)**

UPCOMING ACTIVITIES

- Monitor collared individuals – WDFW/UW
- Fawn and calf captures (NE) – UW
- Ungulate habitat assessment (NE) – UW
- Wolf trapping - WDFW
- Carnivore cluster visits – UW
- Kitten captures (NE) – WDFW
- Maintain and deploy cameras – UW
- Coyote trapping - UW

TAKEAWAYS TO DATE

- No formal analyses have been completed
- No documented mortalities from wolves of radio-collared deer and elk
- All facets, up and running
 - Hit sample size objectives for ungulates
 - Need collars in Huckleberry and Lookout packs
- Collar issues have created some challenges

QUESTIONS?
